

Supplementary Figure 2 | Example genes with significant isoform switching due to switched splice junction usage.

a, Genome browser view of the *AP1S2* locus. Tracks include the finalized SALA transcriptome alongside GENCODE v39 gene and transcript annotations. Switched isoform track displays only transcript models with significant changes in expression fraction between any pair of the three cell types (determined by isoformSwitchAnalyzerR). Color scale represents CPM values normalized within each cell type (from bambu). CFC-seq tracks display the summed signal of 5' ends, 3' ends, and exons across all samples. Tracks for ATAC-seq, cCRE promoter/enhancer regions, and SCAFE tCREs show genomic annotation at this locus. **b**, Isoform expression fractions of *AP1S2* in the three cell types, as estimated by isoformSwitchAnalyzerR. **c**, Predicted ORF alignment of the switched isoforms of *AP1S2*. **d**, Genome browser view of the *PORCN* locus with track structure as in (a). **e**, Isoform expression fractions of *PORCN* in the three cell types. **f**, Predicted ORF alignment of the switched isoforms of *PORCN*.
